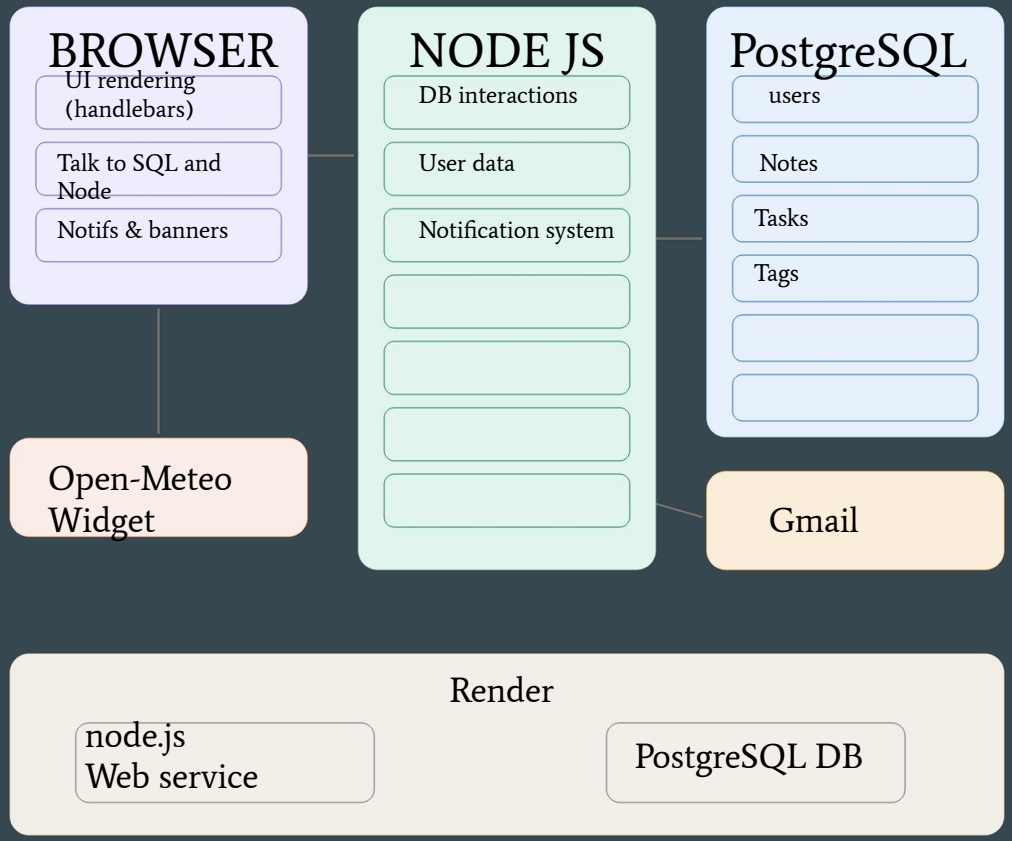
Architecture Diagram



Challenges we faced

- Our initial strategy of half of the team working on the database while the other half worked on the front end code proved to be tricky when the front end team had to use queries and manipulate databases written by other developers.
- Occasional rushed testing to meet wednesday commit requirements caused bugs in our main branch
- Early in the project life cycle, using git commands effectively was a challenge, especially when working with multiple developers at the same time. Over time we learned best practices and had less errors when pushing to our repository.

Future Scope

1.) Shared notes that can be viewed by multiple users and given certain writing permissions by the owner
2.) An email notification system for our tasks (partially implemented)
3.) A calendar option to view task due dates + option to show when notes were made
