Title: Loconotion

Who: Max Pricher, Jacob Hanen, Giovanni Palazzolo, Aubrey Leavenworth

Project Description: A note and goal tracker aimed at students who need a distraction-free, custom note environment.

Project Tracker: https://github.com/users/max-pricher/projects/1

Video: https://youtu.be/cCgQ7NN9Eug

VCS: https://github.com/max-pricher/csci-3800-team-4

Contributions (per team member):

Max (max-pricher) - JavaScript interactions/feature development, Handlebars, styling, Node.js

Aubrey (Cyber1296) - General SQL Database

Gio (PobaG) - Search functionality and AI integration

Jacob(Jhawk100) - worked on the creation of the postgresql database as well as creating all task features.

Test Results:

OBSERVER 1:Amanda Maxwell, CU Boulder sophomore english and sociology major.

Test case 1.)

A user cannot register without completing all of the mandatory fields. Mandatory fields include:

Name

Email Address-will check for proper regEx

Password

Information from the form is stored in the user table in the notion_db database.

Local host will be used to test the feature

the development team will be the testers

OBSERVER 1:

User was at first unsure how to log in without an account; the register text was too difficult to see.

Other than the initial confusion on how to register, the user was able to successfully input their account information and log in to the website. We underlined and changed the color of our register button to make it more noticeable.

Test case 2.)

A user cannot submit a note without completing these mandatory fields:

title

body-will check if empty

Information from the form is stored in the notes table, tags table, and notes_to_tags table in

notion_db database

The user is presented with option to input a tag for their note

Local host will be used to test the feature

The development team will be the testers

OBSERVER 1:

User was able to successfully create a note and view the note in the recently added section.
User had to submit all necessary information before submitting the note
The user had to be informed on the intention of the tag button, which did not go completely with the expectation of the use case, but other than that, the user did not deviate from the expectations of the use case. We made no changes since the tag system is meant to be optional for users who spend more time and hold more information on the website.

Test case 3.)

The search field accurately displays all relevant notes and tags that the user entered in the search field.

Users' input will be stored as a positional parameter in its respective query, and all relevant notes should be returned.

Local host will be used to test the feature

the development team will be the testers

OBSERVER 1:

The user was able to successfully search for notes via note title, body, and tag. The users actions followed the expectations of the use case and no changes were made.

4.)

A user is able to create a task, view all tasks they have made in a sorted manner, and edit all tasks available

Users' input will be stored in the tasks table of the postgresql database, and all tasks will be sorted via postgresql queries. Tasks can be edited via an editTask handlebars page

OBSERVER 1:

The user first attempted to create a task without a specific time in the due date. User was able to successfully create several tasks and have them organized by due date on the task view page. User was able to successfully search for tasks by title as well as edit the tasks. No changes were made since the user was notified when they attempted to submit a task without a time, and our tasks feature is intended to take an exact time.

Extra Credit:

1. Innovative problem selection

i. A clearly defined target audience

The primary target audience for this application is college students who need a simple way to keep personal notes, small tasks, and related tags in one place. This audience fits the current feature set because the project already centers on account-based note creation, organization, and task tracking.

The application is especially useful for students managing several classes at once, because they often switch between lecture notes, reminders, and short to-do items throughout the day. Instead of using separate lightweight tools for each need, this project aims to give them one focused workspace for storing and organizing academic information.

ii. Evidence that the problem exists (brief research, interviews, or validation)

We asked our peers about problems with their current note taking systems and they told us that it would be great to have a program that lets them organize their notes more efficiently.

iii. Explanation of why existing solutions are insufficient

Other solutions lack the ability to add tags to notes or create your own custom groups.

iv. Clear differentiation from a basic tutorial-style app

Advanced SQL queries (tags, tag search operators), 3rd party API (weather widget), cohesive color palette. Various features (notes and tasks).

v. Intentional testing of application with target audience and recording of observation

See test cases above.

2. Creativity of the Website from the UI/UX perspective

-max

The Website has two color palettes. A light mode and a dark mode. The light mode is meant to be simple but fun. The dark mode is very pleasant on the eyes with a pop of color. We also added an event handler to track the user's system preference, so that the website will update depending on your system./browser's preference. All colors were designed using a Coolors color palette generator to ensure contrast levels were sufficient. I further checked the contrast with a W3 Accessibility tool. The colors for every element reference the main Root color palette. The nav bar is fixed at the top of the screen. When a user is logged out, tabs they can't view are hidden. When they log in, they can see all tabs. Styling is a combination of Bootstrap and our own tweaks, such as the palette and some hover effects for buttons. And some sizing. Besides the hover states, we also have a custom logo in our nav bar. The page is very interactive as you can make/view notes/tasks. There's also a weather widget based on the user's location. All content can be accessed with just a keyboard, all buttons can be tabbed into, and all form fields.
